

Welcome to RML.  
This is a paragraph of 'flowing' text.  
I've used the <nextFrame> tag to force this text to appear in this frame, by specifying the frame id.

...this text will appear in the second frame, even though the first frame isn't full yet.  
It also appears first in the RML file, before the text in the frame on the left.  
Don't forget that you would normally see output without borders around the frames. This has been set to appear just to clarify where the frames are.  
When I use the <nextFrame> tag without specifying a frame name....

...we just move into the next frame listed in the <pageTemplate> section.

This frame demonstrates how to force text to stay inside a frame. Use the <keepInFrame> tag to either shrink the text to fit, truncate it, overflow the frame, or raise an error.
