We will now set the next page
template to layout 2, and use
nextFrame to force text into the
next frame, thereby creating page
2.

This is Layout #1

This is Layout #2

In this example, there is more than one frame in the template for page one. If there hadn't been enough text to fill up all the frames, we might have needed more than one <nextFrame> tag to push the text onto a new page. That's because the <setNextTemplate> doesn't actually start using the next template immediately; you have to either fill up the frames with text, or specify enough <nextFrame> tags to account for any empty frames, before a new page will be created.
